

**TN540 SR-39-5 Multiple Power Amplifier Subrack**

The SR-39-5 subrack is designed to hold and interconnect the MT-3 series of power amplifiers on one universal motherboard. The MT-3 amplifiers are also used with the MT-4 series of transmitters. The SR-39-5 subrack holds up to three power amplifiers.

The multiple power amplifier subrack does not have a voltage regulator built in, and requires the main power lines (13.8 Vdc and 9.5 Vdc) to be connected from another subrack. The motherboard distributes the power to each power amplifier.

Multiple Power Amplifier Subrack

The multiple power amplifier subrack is ideal for multi-channel trunking systems with the multiple receiver subrack and multiple transmitter subrack.
